Week 1 — OpenClaw Architecture Fundamentals

Overview

The proposed system uses OpenClaw to receive a property-related question, choose the appropriate skill, query the relevant MLS table, and return an answer. The workflow below follows the structure given in the internship handbook. The WhatsApp channel has been linked and tested with a sample message; the live agent-to-database workflow is a planned component, not yet fully tested.

Workflow Diagram

Main Components

Skills: Separate capabilities for property search, market statistics, recommendations, RAG knowledge retrieval, and email drafting.

Channels: Ways users interact with the agent: WhatsApp (primary), email, and web.

Sessions: Keep the current conversation linked to a user so follow-up questions have context.

Tools: Functions that carry out tasks, such as reading listing details from a database.

Memory: Stores short-term conversation context; long-term retrieval can be added later.

Orchestrator: Decides which skill or tool should handle a request.
